

Helix Codex

The operations OS your team can actually own.

Chat, docs, tasks, calendar, on-call, attendance and an AI organization that executes — behind an audit trail, on your own hardware.

What's inside

01 The problem

Six subscriptions, rented data, and AI that only suggests.

02 The platform

Chat, docs, tasks, calendar, on-call and attendance in one place.

03 The intelligence

Nine agent roles, governed workflows, and a memory that improves with use.

04 The offer

Four tiers. Sample data is free. Live data is paid.

Three things operations teams are tired of

1

Your stack is six subscriptions

Chat in one app, documents in another, tasks somewhere else. Nothing talks to anything, and you pay for all of it.

2

Your data lives in someone else's cloud

The roster, the CRM, the payroll export. All rented, all out of your hands, all priced per seat, forever.

3

Your AI only suggests

It writes a tidy paragraph. Then a person retypes it into the system that actually does the work.

One app for the whole company

Chat

Documents &
SOPs

Tasks

Calendar

On-call

Attendance

Notifications

Knowledge base

Plus two sections most people never see:

Operations

Engine overview and governed workflow approvals.

The Cockpit

The owner's numbers. Managers and owners only, enforced server-side.

A day in the app

Every one of those actions is recorded. The audit trail is not a separate system bolted on at the end.

An AI organization, not a chatbot

SAMI

Executive Coordinator / CEO

SUBY

OPS GM

PHILI

HR & Personnel GM

WILI

L&D GM

MAYA

Marketing GM

LIZA

Sales GM

ANDY

Compliance & Quality GM

TOMY

ICT GM

NONO

Fraud & Revenue Assurance GM

Nine roles with a named responsibility, an approval limit and an owner to escalate to.

Operations that run on a rail

Submit

A manager raises the request.

Gate

The governance gate checks it.

Approve

An approver decides, and the reason is recorded.

Execute

The engine runs the work.

Audit

The action lands in the trail with its correlation id.

- Every mutating action goes through the engine and a gate.
- Nothing executes without the approval it requires.
- Every step keeps its correlation id, so any action can be traced end to end.

The owner's cockpit

From the Sports Academy capability pack - the first vertical pack.

- Managers and owners only. The check runs at the route, again in the service, and again at the policy seam.
- Simulated data is labelled on every card. Nothing on this screen pretends to be live.

Every person gets a memory that improves with use

- **Propose an improvement**
- **Evaluate it against history**
- **See the evidence**
- **A human approves**
- **Versioned and reversible**

Nothing applies itself. A user's own approval is never enough to make a rule company-wide — that takes a second, independent approver.

What the reviewer actually sees

The baseline rate before the change.

The candidate rate after it.

The difference between the two.

How many historical cases were used.

How many simulated cases were used.

The governance is real, not a slide

Fail closed

When a control cannot be checked, the action is denied and an error is raised. It never quietly carries on.

Every action is a node

Each write carries its tenant, classification, provenance and a correlation id that survives every boundary.

Simulated stays labelled

Synthetic, historical and live data look different on screen. Always.

Improvement is a proposal

Nothing self-deploys. It takes evaluation, review, approval, a version and a rollback path.

Accounts, roles and limits

How people sign in

A username and a domain, so one company is one tenant.

Passwords hashed with bcrypt, never stored in the clear.

Opaque cookie sessions. No tokens to leak.

A CSRF check on every write, not just the important ones.

Lockout after repeated failures, and sessions that revoke the moment an account is disabled.

Who reaches what

Employee

Chat, documents, tasks, calendar and the punch clock.

Manager

All of that, plus operations, team views and memory review.

Owner

All of that, plus the cockpit, admin and the evidence export.

Built for the phone in their pocket

- **Installs from the browser**

No app store, no review queue, no download to explain to staff.

- **Works when the signal does not**

The shell and the pages you last opened stay readable offline.

- **One-handed by design**

44 pixel tap targets and a bottom nav that sits under the thumb.

- **Opens instantly**

System fonts and no build step, so there is nothing to wait for.

Grows with the business, not against it

A capability pack declares its own sections, roles, workflows and metrics. Five rules stop a pack from quietly widening its own authority.

01

Cannot raise a role's spending limit.

02

Cannot claim a capability another pack already owns.

03

Cannot use live data unless its readiness is established.

04

Version-gated. A pack too new for the core will not load.

05

Cannot review its own actions.

Add a section without touching core code. It stays hidden from anyone without the permission, and the route refuses them even if they try it directly.

Options

Community

\$0

One tenant, sample data, self-hosted on your own machine.

Helix Cloud

\$9

Per seat, per month, billed annually.
Minimum five seats.

Capability Packs

\$49-\$499

Per month, or \$1,500 to \$5,000 perpetual.

Enterprise

\$15k-\$50k

Per year. Deployment, onboarding and support.

The boundary is simple: sample data is free, live data is paid.

Why this wins where the giants don't

The usual stack

Data location

Someone else's cloud.

The AI's role

Suggests. A person retypes it.

Cost shape

Per seat, per module, forever.

Customisation

Whatever the vendor roadmap allows.

On a phone

A cut-down web view.

Helix Codex

Data location

Your hardware, your rules.

The AI's role

Executes inside a governance boundary.

Cost shape

Self-host for nothing. Pay for live data.

Customisation

Capability packs you add without touching core.

On a phone

An installable app that works offline.

Start with one academy.

Scoach Academy Hub is the first deployment. A working pilot in weeks, not quarters.

1

Run the pilot

Sixty days, your data, your hardware, no migration project.

2

Add your capability pack

The sections and metrics your business actually uses, not a generic template.

3

Own the result

The code, the data and the audit trail stay with you.
